Campinas

Now, introducing my self

- Food Engineer from the Federal University of Viçosa, Brazil (1983).
- Master in Food Engineering from the State University of Campinas, Brazil (1987).
- "DEA" in "Génie des Procédés Option Génie Alimentaires" from the "Ecole Nationale Supérieure Des Industries Alimentaires", France (1988).
- PhD in "Génie des Procédés" by the "Institut National Polytechnique de Lorraine", France (1992).
- Assistant Professor at USP (1993).
- Associate Professor (by defending a 2nd thesis) (2000).
- Full Professor (2007).
- Researcher PQ1B of CNPq

- **Teaching:**
 - Mass transfer (UG)
 - Physical-chemistry of foods (UG and PG).
- **Research topics:**
 - Biopolymers-based Film Technology.
 - Nanoparticles and nanocomposites.
 - Biopolymers-based hydrogels.
 - Biomaterials: scaffolds.
 - Emulsions and nanoemulsions.
 - Food classifications.

- **Team:**
 - 2 Technicians (PhD and Master)
 - 9 PhD Students
 - 2 Post-docs.
- **Laboratory:** SEM, AFM, FTIR, DSC, automatic film spreader, network analyzer, freeze-dryer, rheometer, texturometer, Aw Decagon, colorimeter, glossmeter, Microfluidizer, Lumisizer, RH/T controlled oven, among others.

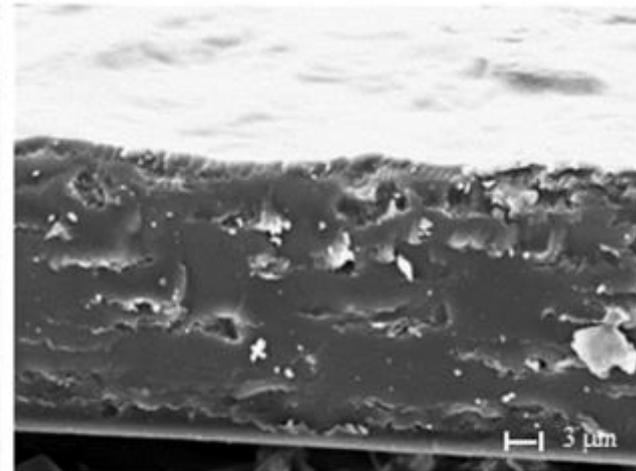

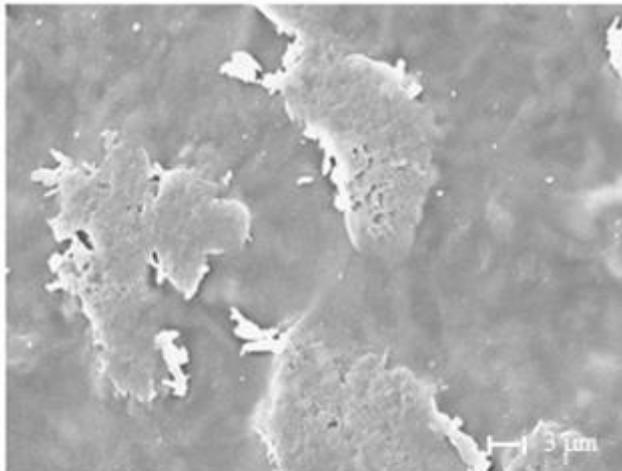

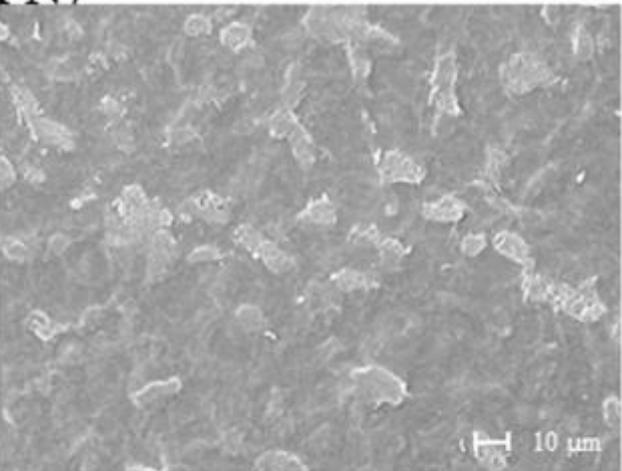

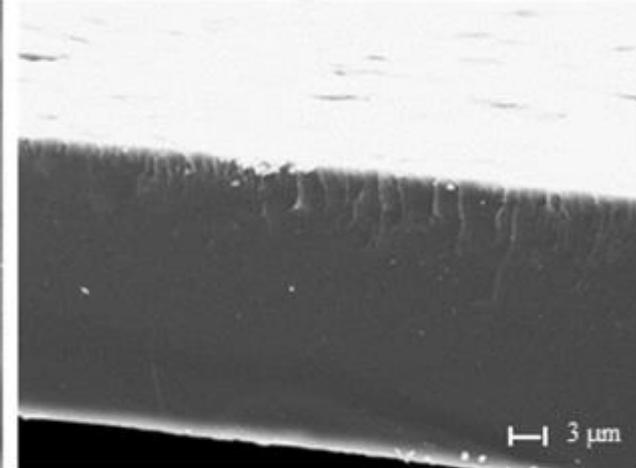

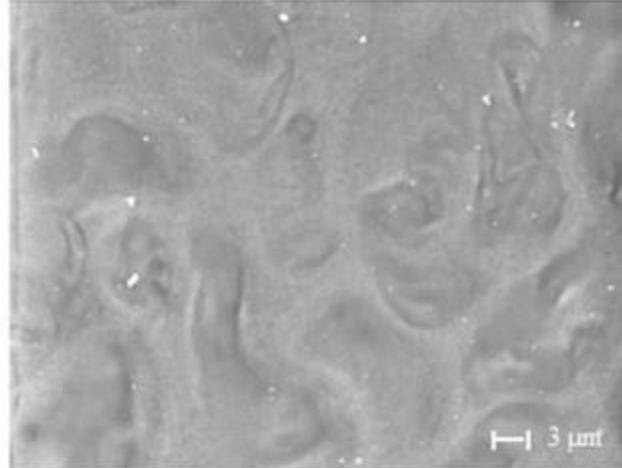

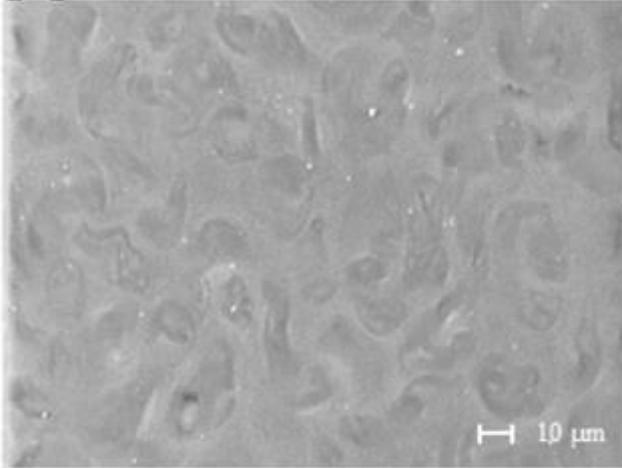

Fig. 1. SEM surfaces (500x, scale bar = 10 μm; 2000x, scale bar = 3 μm) and cross-sections (2000x, scale bar = 3 μm) of the control film (FC) and nanocomposites reinforced with cellulose nanofibers that were passed through the high-pressure homogenizer zero (FN0), three (FN3), five (FN5), and seven (FN7) times.

On active films based on biopolymers

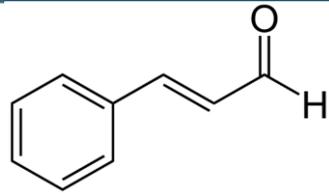

Active agents

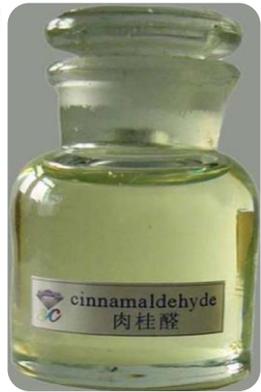

Examples of active agents used to produce active films:

- i) Vegetable extracts: from herbs, spices, leaves, ...
- ii) Purified compounds: carotenoids, phenolic compounds, α -tocopherol, essential oils, nisin, natamycin...

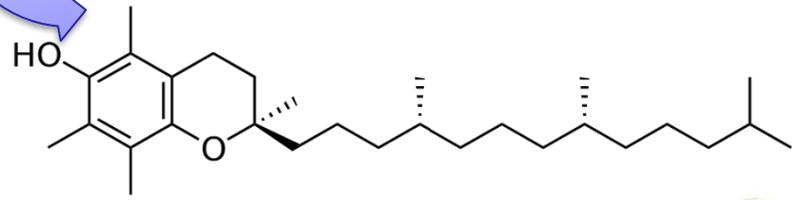

Purified compounds

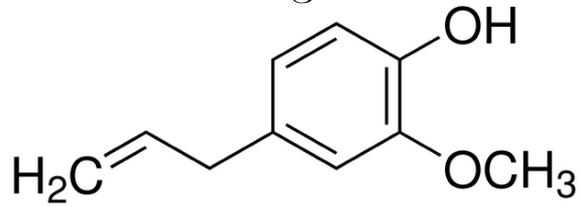

<https://en.wikipedia.org/wiki/Alpha-Tocopherol>

<https://hypeltradeindia.com/cinnamaldehyde-1090836.html>

Eugenol

<http://www.natural-health-news.com/garlic/>

Vegetable extracts

water:ethanol proportions in solvents: 100:0, 80:20, 60:40, 40:60, 20:80, 0:100.

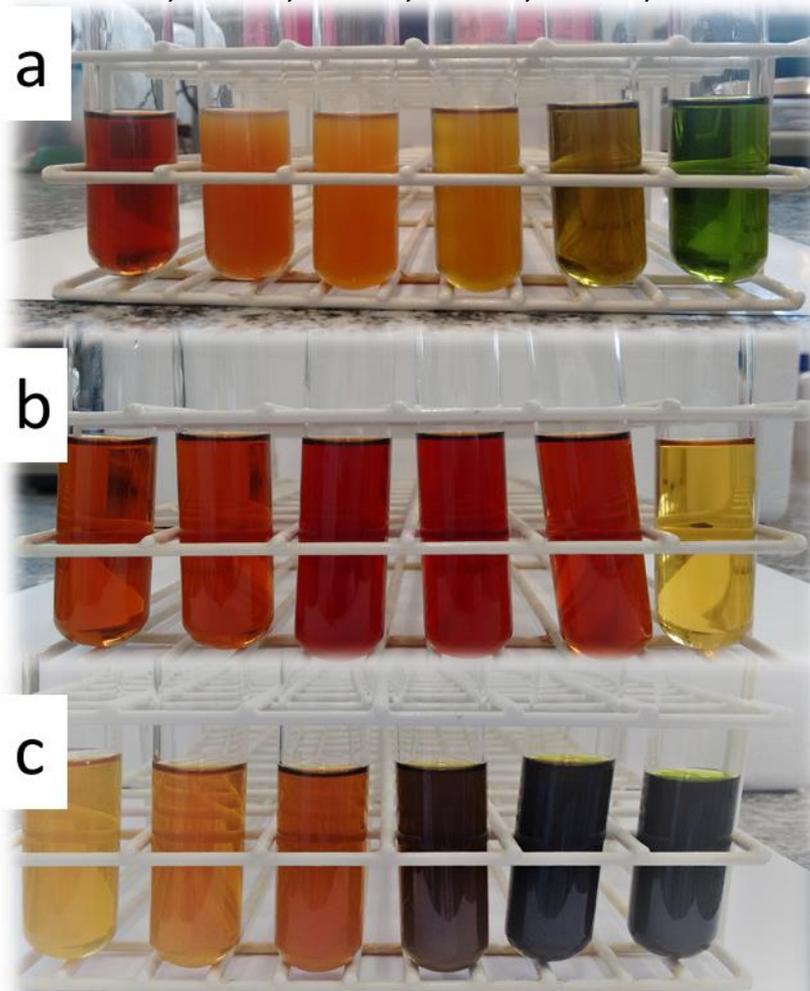

Hydroethanolic extracts from plant materials:

a) Carqueja,

b) Guarana

c) Pitangueira leaves.

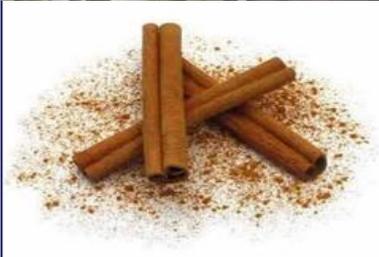

Vegetable extracts Compositions

Rosemary: eucalyptol, linalool, camphor, α -pinene, terpinen-4-ol, camphene, β -pinene, D-limonene, ρ -cymene, n-hexadecanoic acid, endo-borneol, L- α -terpineol, caryophyllene, bornyl acetate, tetradecanal.

Boldo: 1,8-cineol, ρ -cymene, phytol, eicosanoic acid, cis,cis,cis-7,10,13-hexadeca trienal and α -irone.

Cinnamon: cinnamaldehyde and α -copaene.

Guarana: caffeine,

as determined by GC-MS by Bonilla and Sobral (2017a).

Vegetable extracts Compositions

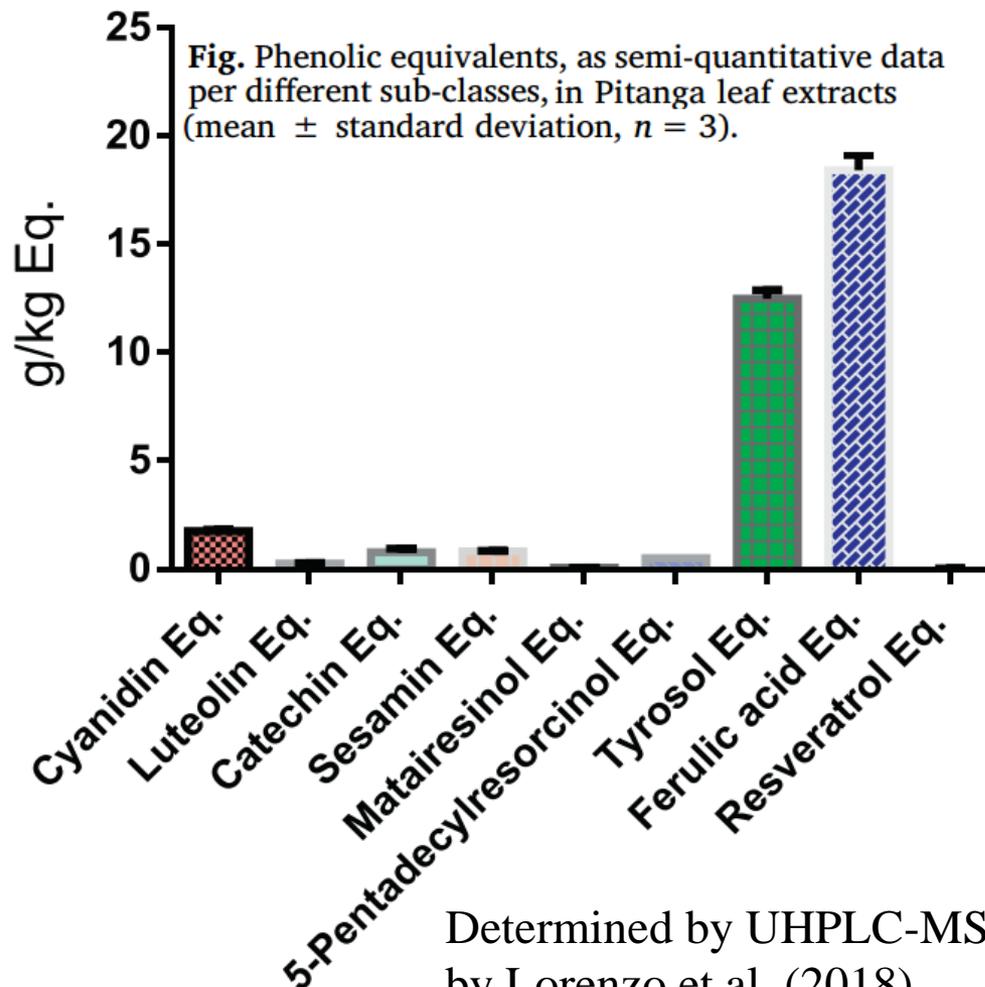

Table Individual abundances (as g kg^{-1} equivalents) for each phenolic sub-class identified in guarana seed extracts (GSE).

Phenolic class equivalent	g kg^{-1}
Tyrosols	14.74 ± 2.64
Phenolic acids	7.38 ± 1.03
Anthocyanins	3.65 ± 0.67
Alkylphenols	1.33 ± 0.08
Flavonols	0.59 ± 0.10
Flavones	0.48 ± 0.08
Stilbenes	0.02 ± 0.00
Lignans	0.01 ± 0.00

Determined by UHPLC-MS by Gómez et al. (2018).

Vegetable extracts Compositions

Determined by UHPLC-MS by Lorenzo et al. (2018).

Antimicrobial activity

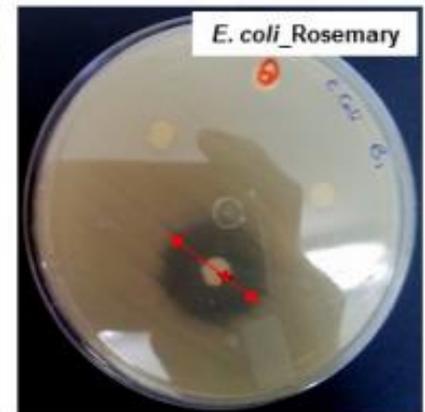

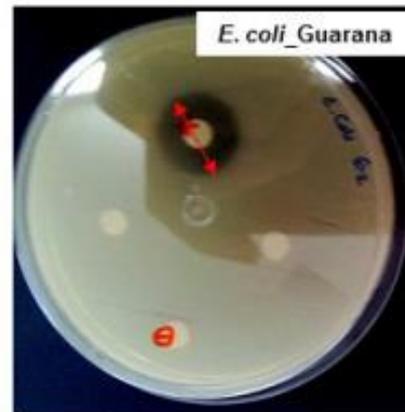

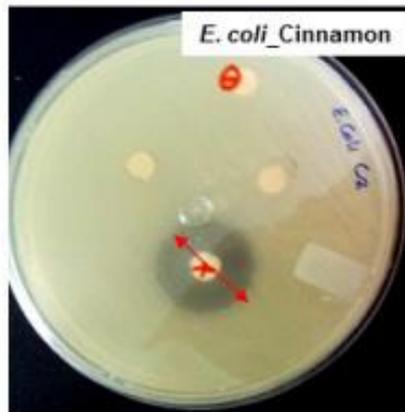

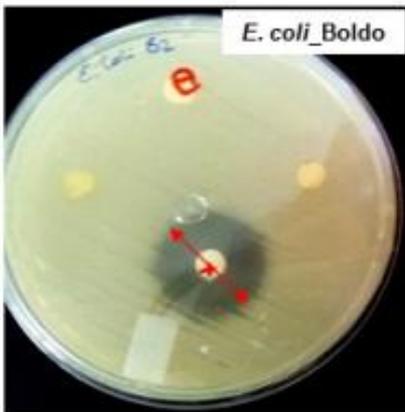

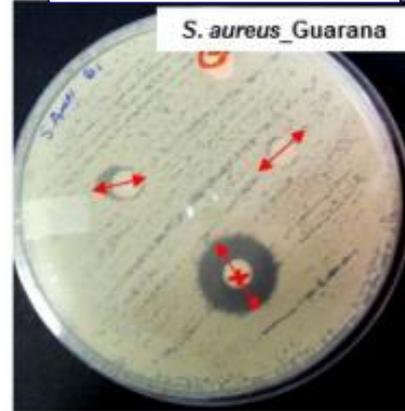

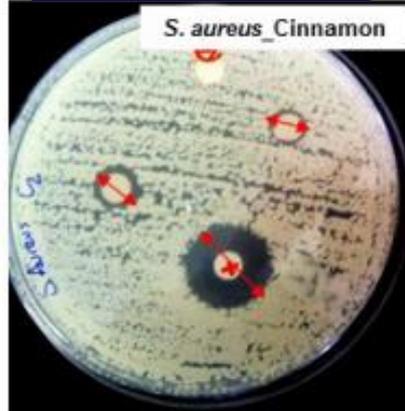

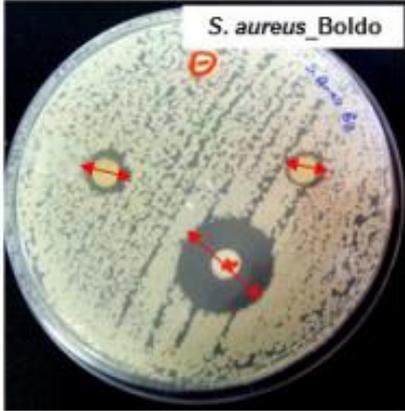

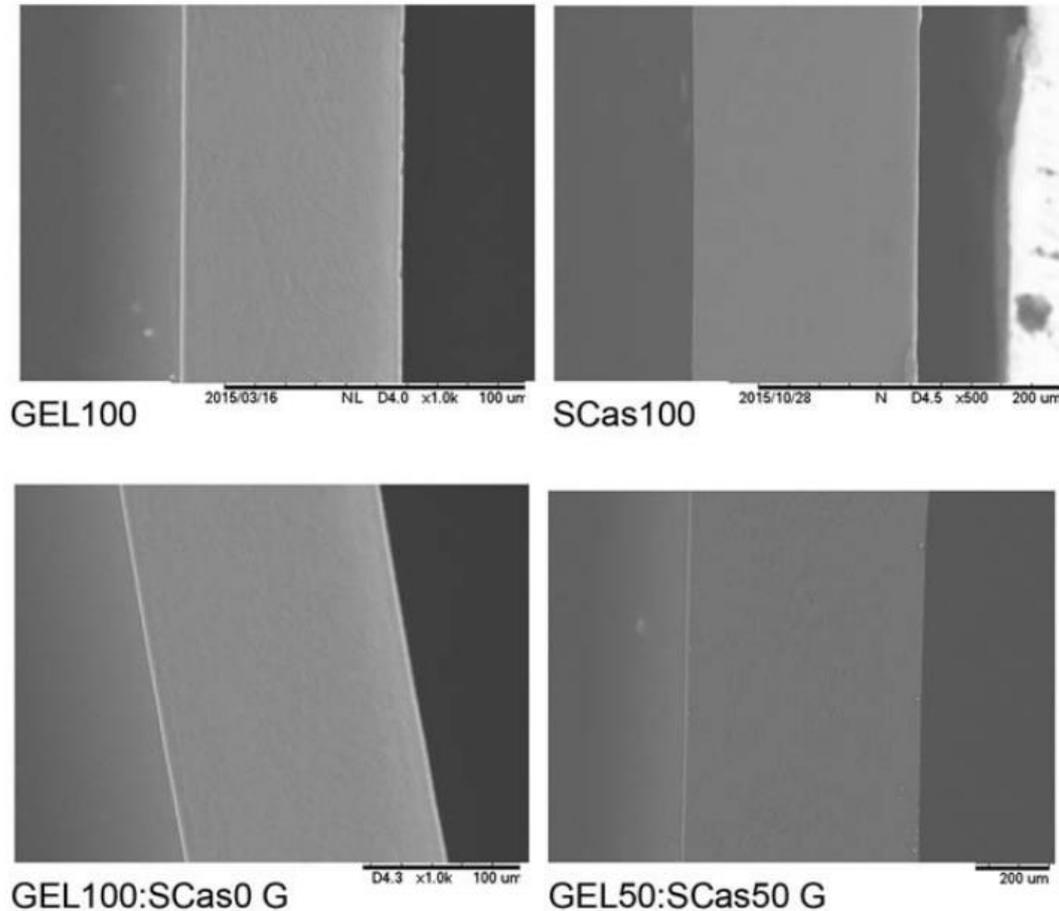

Figure Inhibition of bacterial growth (*E. Coli* and *S. Aureus*) by the boldo of Chile (*Peumus boldus molina*), cinnamon (*Cinnamomum sp.*), guarana (*Paullinia cupana*) and rosemary (*Rosmarinus officinalis*) extracts.

Source: Bonilla & Sobral (2017).

Active films with vegetable extracts

Films based on blends of gelatin/sodium caseinate, loaded with extracts of cinnamon, guarana, rosemary and boldo.

(Bonilla et al., 2017b).

Figure Examples of scanning electron microscopy (SEM) images of cross-sections of biopolymer pure films (GEL100 or SCas100) and blend films (GEL100:SCas0 or GEL50:SCas50) with guarana (G) extract.

Active films with vegetable extracts

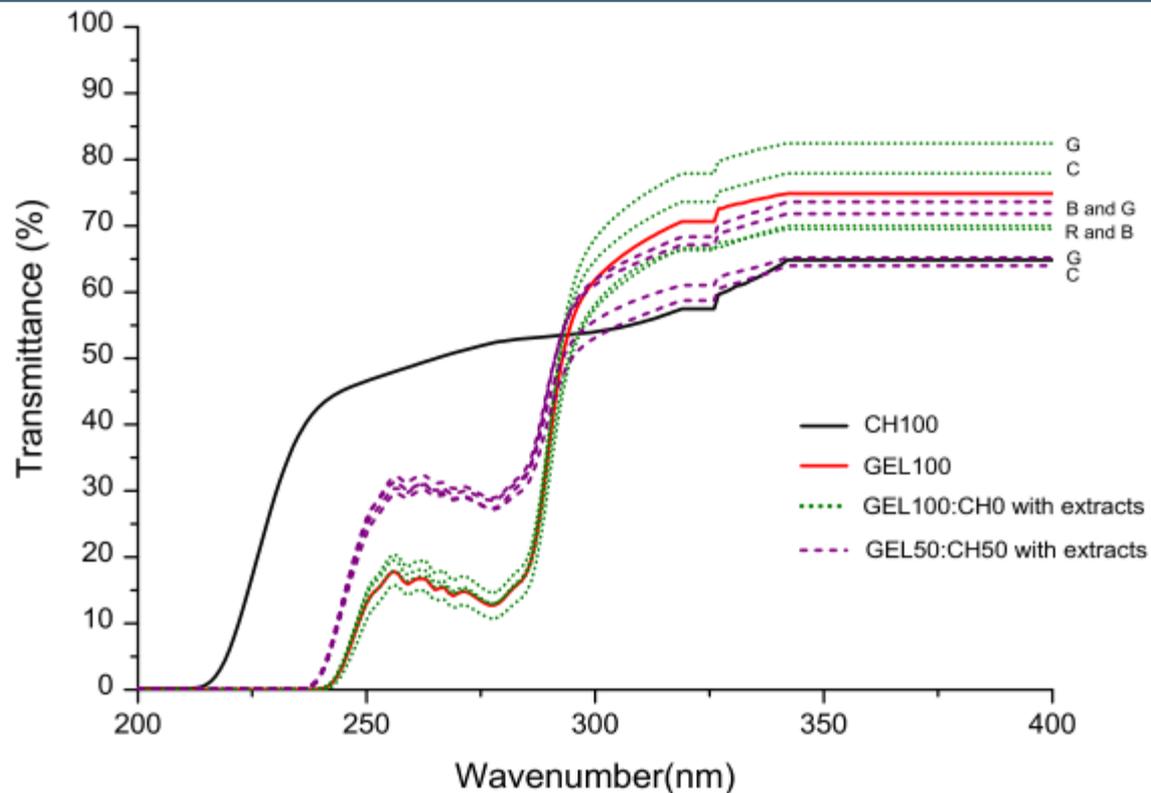

Fig. UV-Vis spectra for pure chitosan films (CH100), pure gelatin films (GEL100) and GEL100:CH0 and GEL50:CH50 blend films with guarana (G), boldo (B), cinnamon (C) and rosemary (R) extracts.

Active films with emulsified active compound

Eugenol nanoemulsions stabilized with soy lecithin or sodium caseinate (Dammak & Sobral., 2019).

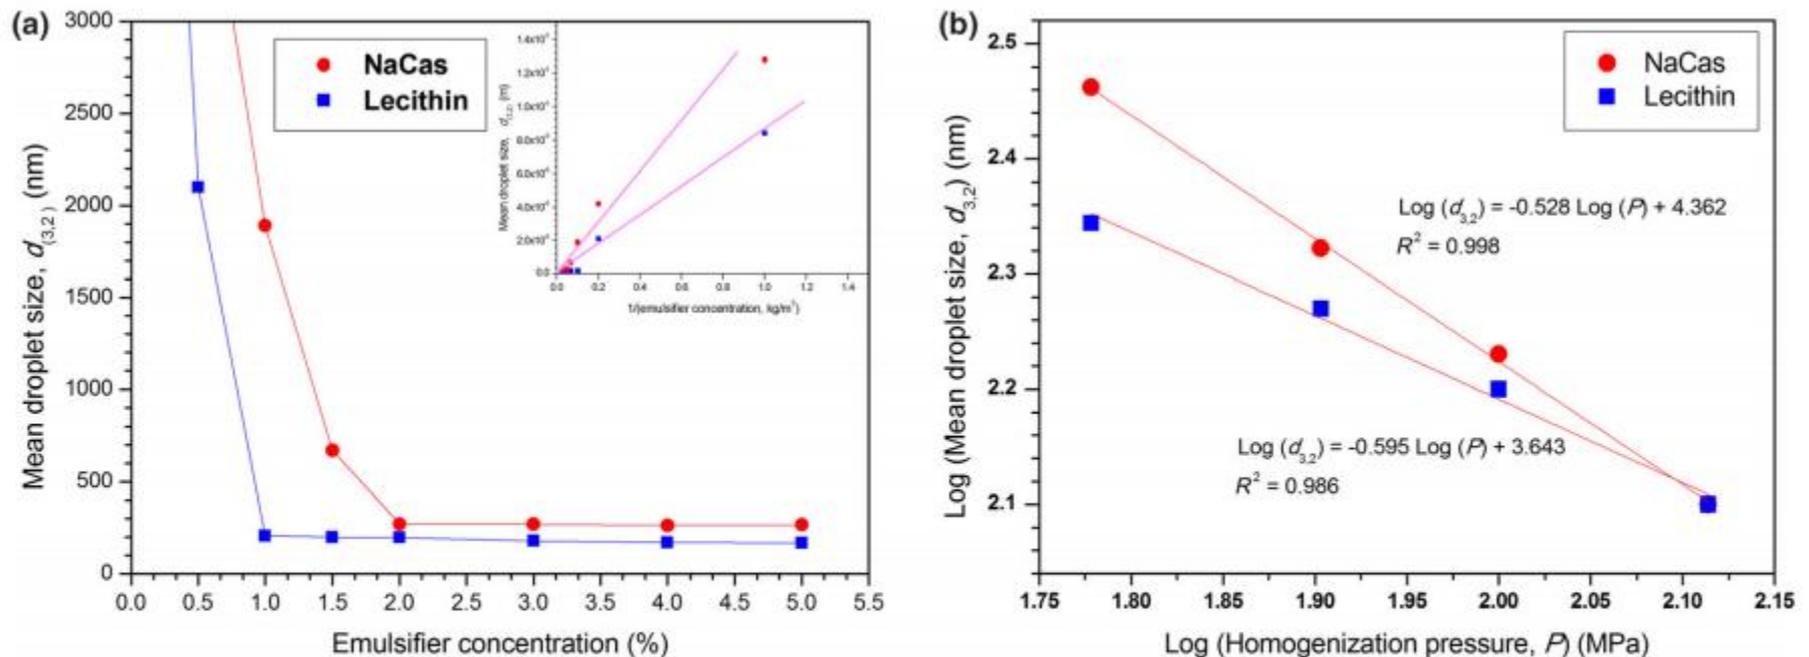

Figure (a) Mean droplet size ($d_{3,2}$) of eugenol-loaded nanoemulsions as a function of soy lecithin and sodium caseinate concentrations; the inset graph was plotted using eqn 1. All of these nanoemulsions were produced under standardised homogenisation conditions (100 MPa, three cycles). (b) Influence of homogenisation pressure (three cycles) on the mean droplet size ($d_{3,2}$) of eugenol-loaded nanoemulsions stabilised with 1% (w/w) of soy lecithin and 2% (w/w) of sodium caseinate. [Colour figure can be viewed at wileyonlinelibrary.com]

Active films with emulsified active compound

Eugenol nanoemulsions stabilized with soy lecithin or sodium caseinate (Dammak & Sobral., 2019).

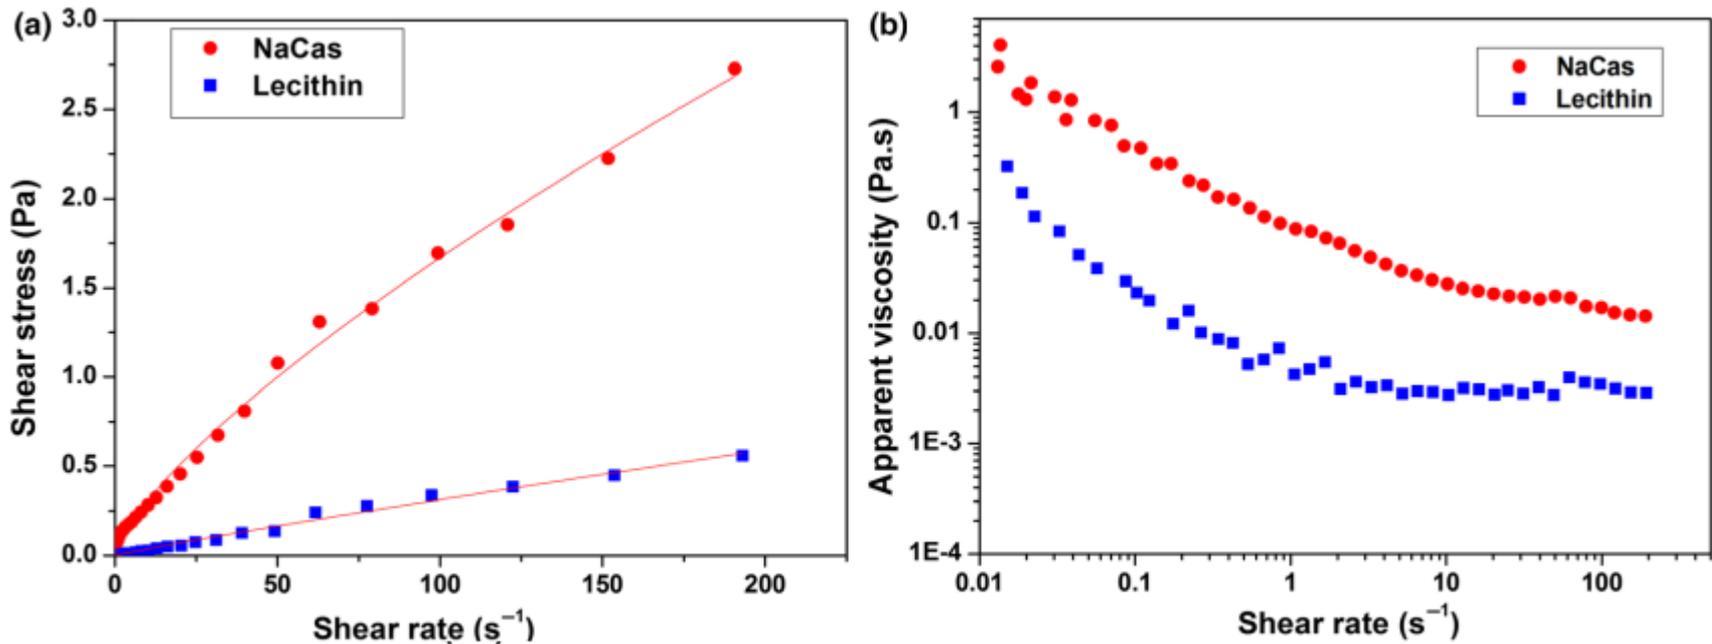

Figure (a) Flow behaviour of sodium caseinate and soy lecithin-stabilised nanoemulsions encapsulating eugenol. The lines were plotted using eqn 2. (b) Apparent viscosity as a function of the shear rate.

Active films with emulsified active compound

Films of gelatin with eugenol nanoemulsions stabilized with soy lecithin or sodium caseinate (Dammak & Sobral., 2019).

Table Thermal properties and Trolox-equivalent antioxidant capacity (TEAC) of the gelatin films

Gelatin films added with NE	1st Scan			2nd Scan	TEAC ($\mu\text{mol TE per g of dry weight film}$)

Another approach: Pickering emulsion

Pickering emulsions are formed when solid colloidal particles are adsorbed to the interface of emulsion's droplets, stabilizing them (Manoharan, 2006).

ChiNP characteristics

$d = 38.4 \pm 11 \text{ nm}$

Span = 0.25

* The values (-1), (0) and (1) are coded levels.

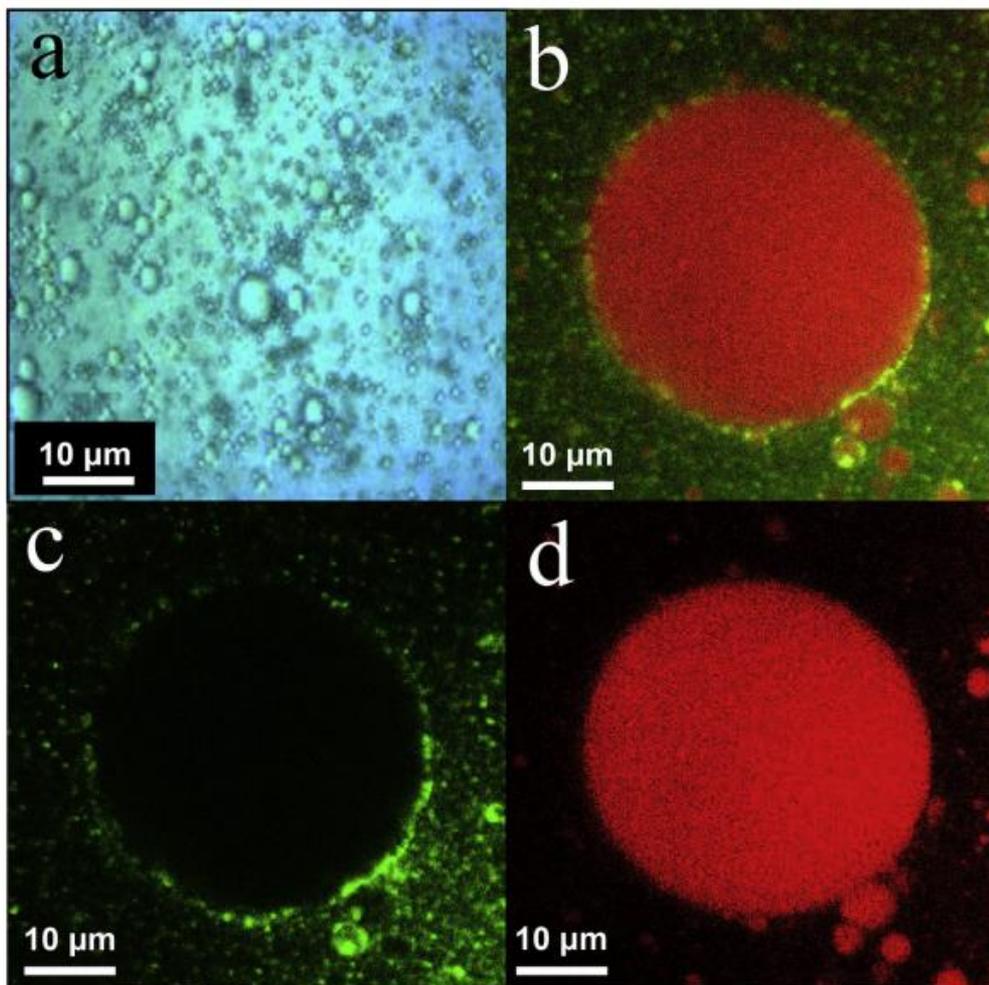

Optimal conditions regarding ESI:

ChiNP = 1.1% (w/w)

Lecithin= 4.4% (w/w)

O/W ratio= 0.24 (v/v). Source: Dammak & Sobral., (2018)

Pickering emulsions carrying hesperidin characteristics

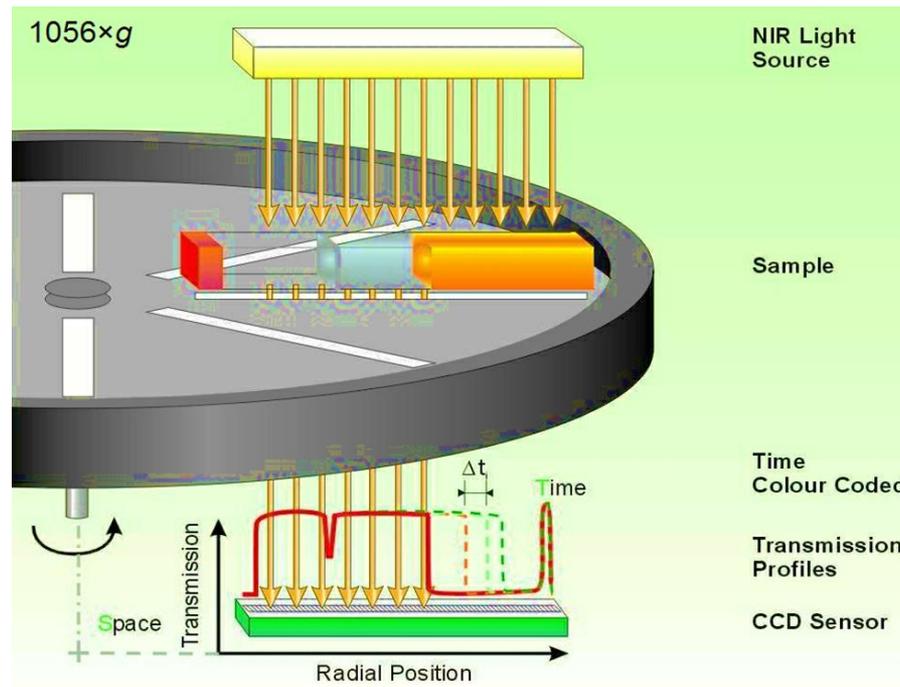

Source: Dammak & Sobral. (2018)

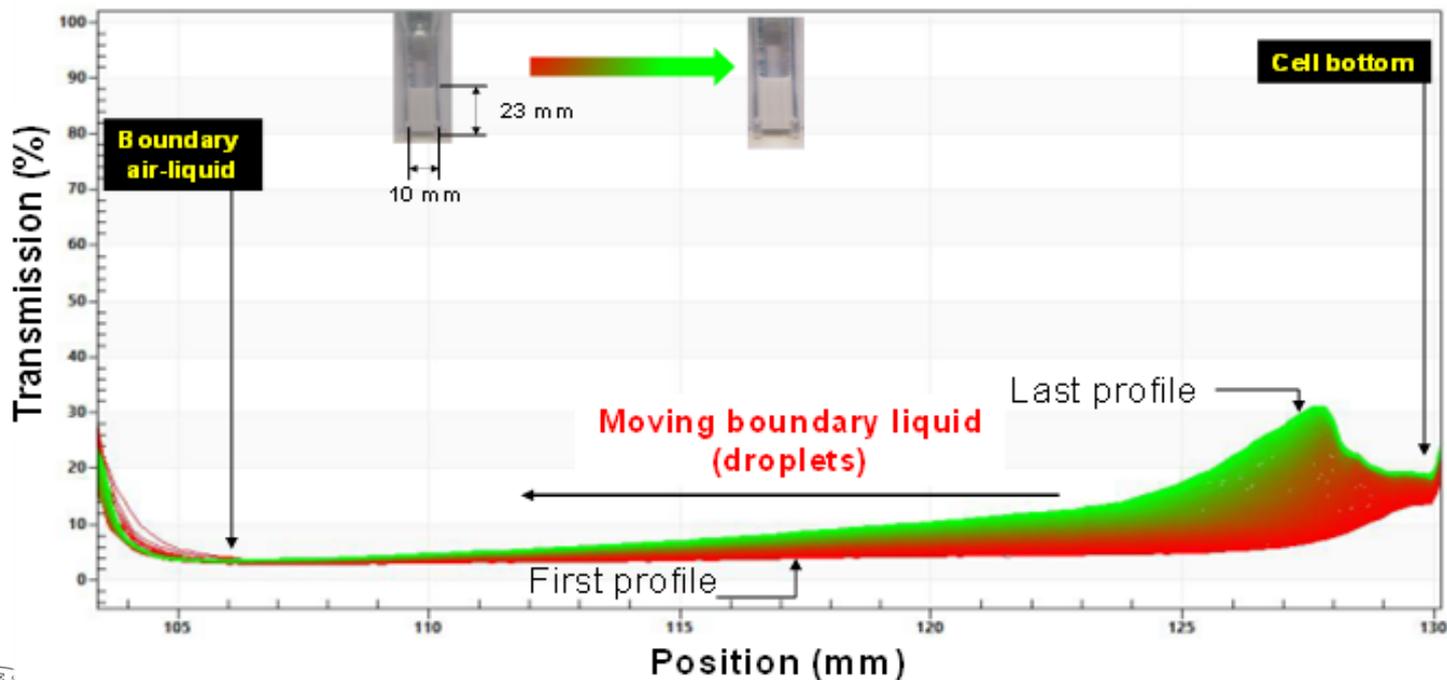

(a) Optical micrograph of emulsion droplets prepared under optimal conditions. (b) Confocal laser-scanning microscopy (CLSM) micrograph of emulsion droplets after labeling of oil and chitosan nanoparticles. (c) CLSM micrograph of labeled chitosan nanoparticles. (d) CLSM micrograph of labeled oil phase.

Physical stability of emulsions: Determined using a analytical centrifuge (Lumisizer®)

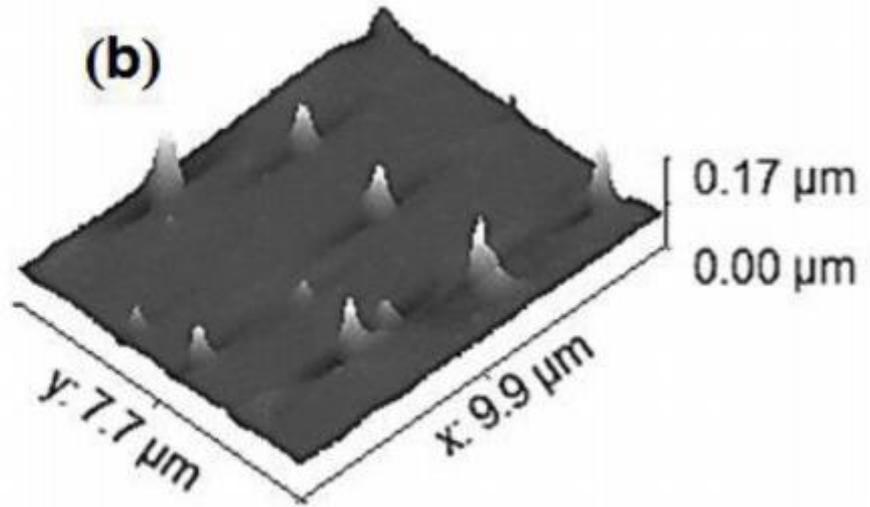

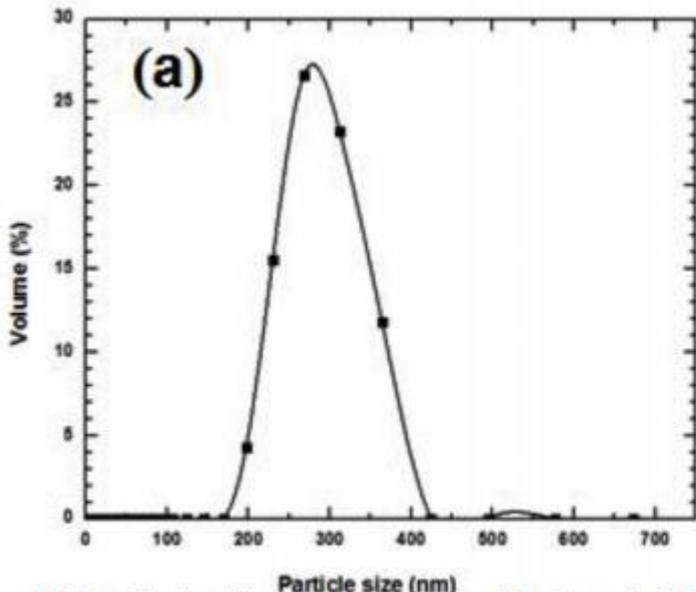

Physical stability of Pickering emulsions carrying hesperidin characteristics

And finally: Active film-Pickering emulsion

ChiNP characteristics

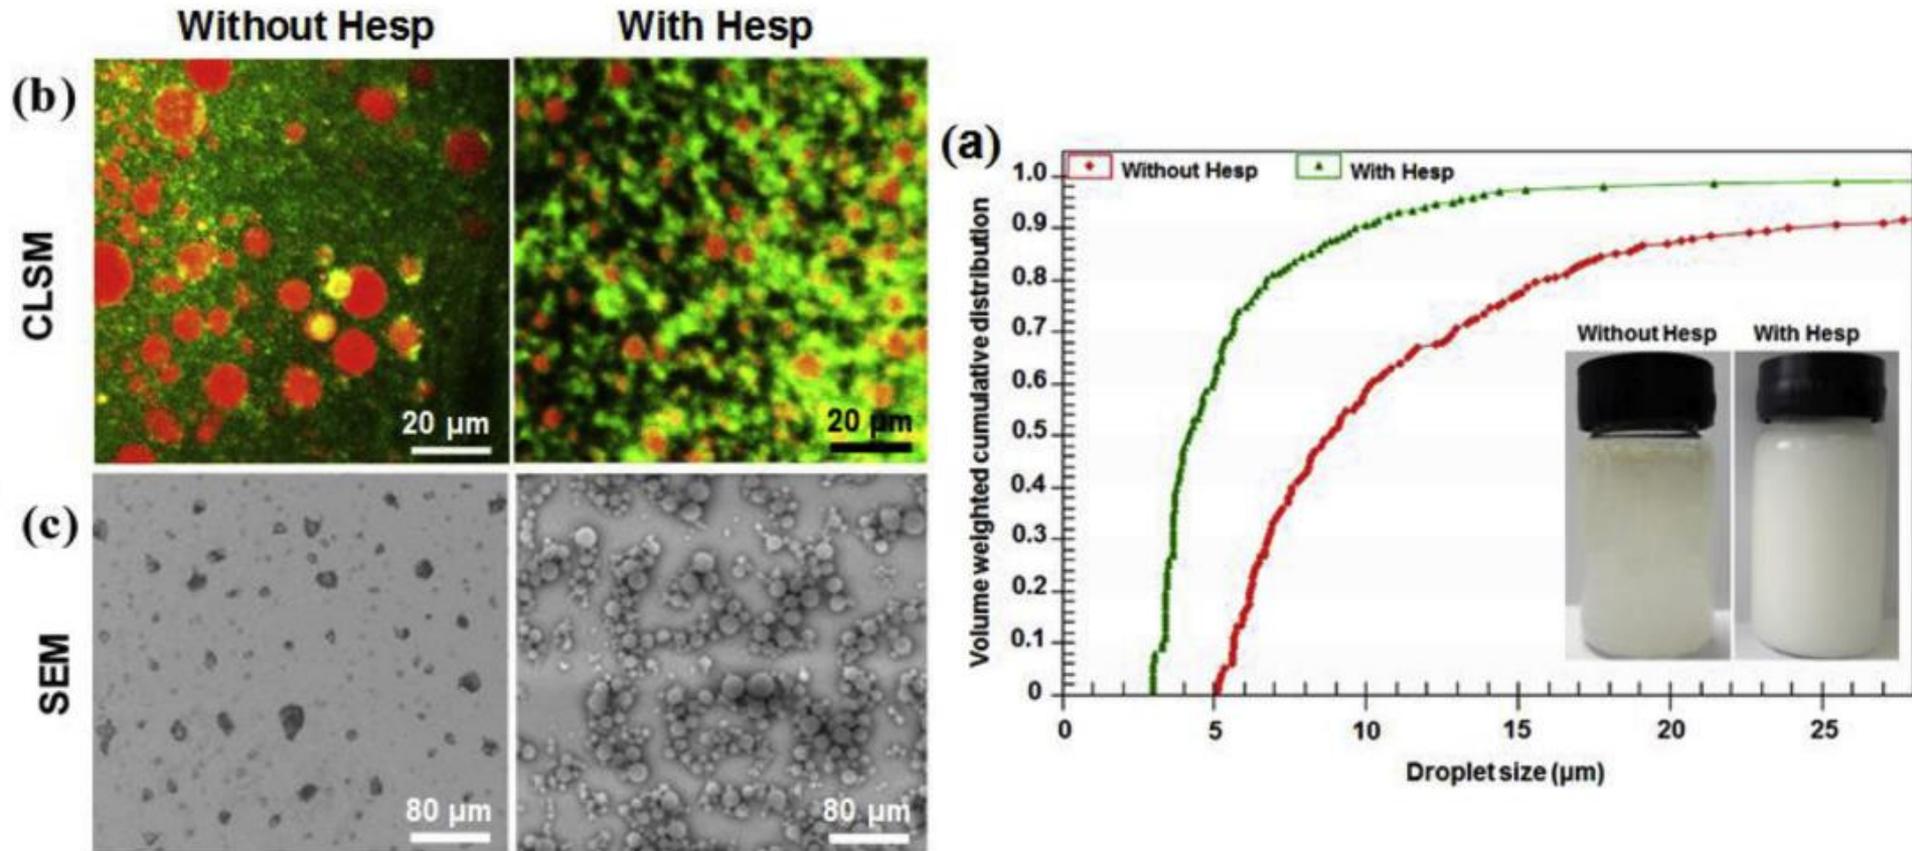

(a) Particle size distribution determined by dynamic light scattering; (b) height profile and (c) ChiNP images obtained by atomic force microscopy. Sample was diluted at 1:150 in distilled water.

$$d = 280 \pm 11 \text{ nm and Span} = 0.4 \pm 0.1$$

Pickering emulsions carrying hesperidin characteristics

(a) Appearance of the ChiNP-stabilized emulsions without and with Hesp after 2 h of storage and droplet size distribution, (b) CLSM micrographs, and (c) SEM images of ChiNP-stabilized Pickering emulsions.

The mean droplet size, polydispersity index and hesperidin retention of O/W Emulsions prepared with and without hesperidin at two homogenization speeds.

	Homogenization speed 5,000 rpm		Homogenization speed 10,000 rpm	
	Without hesperidin	With hesperidin	Without hesperidin	With hesperidin
Mean droplet size (μm)	$15.3 \pm 1.2^{\text{a}}$	$8.3 \pm 1.7^{\text{c}}$	$9.5 \pm 2.0^{\text{b}}$	$5.4 \pm 2.0^{\text{c}}$
Polydispersity index (-)	$0.7 \pm 0.1^{\text{a}}$	$0.4 \pm 0.3^{\text{c}}$	$0.5 \pm 0.1^{\text{b}}$	$0.3 \pm 0.1^{\text{d}}$
Hesperidin retention (mg/mL)	-	$0.81 \pm 0.02^{\text{a}}$	-	$0.72 \pm 0.02^{\text{b}}$

Mean \pm standard deviations from triplicate determinations.

^{a-d} Different letters in the same row indicate significant differences at $p < 0.05$.

Active films characteristics

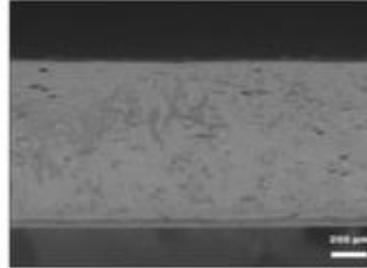

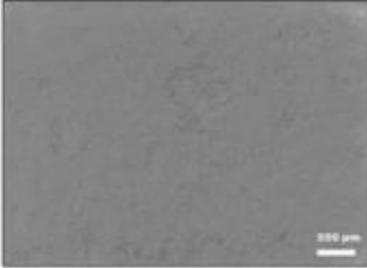

(a) Surface

(b) Cross-section

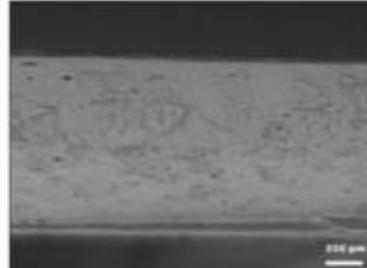

Films 5%

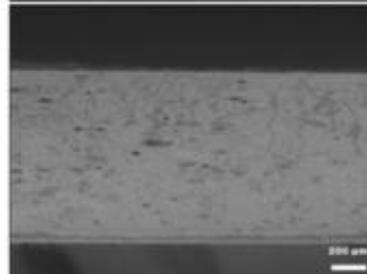

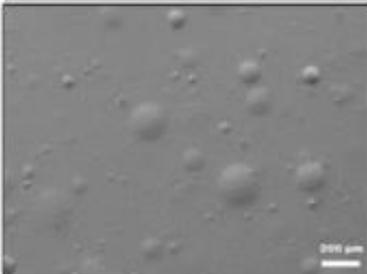

Films 10%

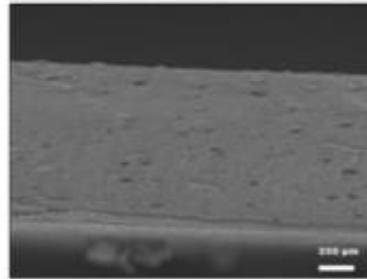

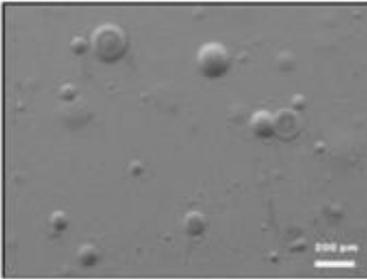

Films 20%

Films 30%

Films 50%

FACULDADE DE ZOOTECNIA E ENGENHARIA DE ALIMENTOS

(a) Top-surface and (b) cross-section SEM images of films incorporated with different levels of Pickering emulsions. Levels of Pickering emulsions are indicated in figures.

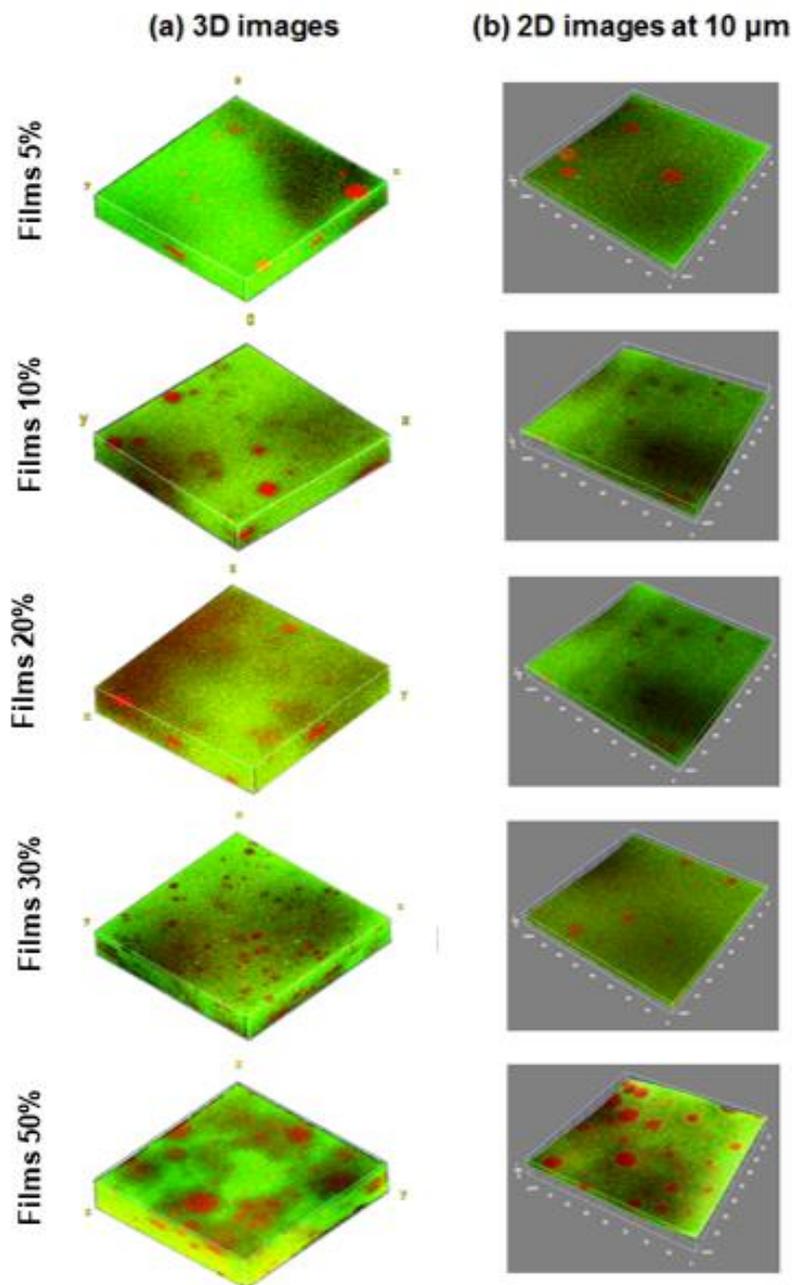

Figure. (a) 3D CLSM images of films with different levels of Pickering emulsions; (b) 2D CLSM images at a penetration depth of 10 µm of films with Pickering emulsions. Scale bar is of 20 µm.

Calculated mean droplet size and polydispersity index of oil droplets incorporated into the active gelatin films.

Incorporation level (g oil/ 100 g gelatin)	Mean droplet size (μm)	Polydispersity index
5%	6.4 ± 2.2^a	0.4 ± 0.02^a
10%	7.2 ± 2.3^a	0.3 ± 0.03^a
20%	6.2 ± 1.8^a	0.3 ± 0.04^a
30%	7.2 ± 2.1^a	0.4 ± 0.03^a
50%	8.4 ± 2.5^a	0.5 ± 0.05^a

Mean \pm standard deviations from triplicate determinations.
 Different letters in the same column indicate significant differences at $p < 0.05$.

Final Remarks

We worked a lot, but a lot of research still needs to be done to have a material with high potential for application in the food industry.
